DATABASE DESIGN & IMPLEMENTATION

ICT Skills

Objectives

- Anatomy of an SQL statement
- Arithmetic in the SELECT CLAUSE
- NULL values in arithmetic
- Column Aliases
- Concatenation
- Construct query to sort a result set in ascending or descending order
- Construct a query to order a result set using a column alias
- Construct a query to order a result set for single or multiple columns

Anatomy of a SQL statement

- SELECT is one of the most important, if not the most important keyword in SQL.
- SELECT allows you to search for specific data in a database
- The SELECT statement must contain a SELECT clause and a FROM clause
- The list of columns in a SELECT clause allows you to conduction projection i.e. columns in a table.
- The WHERE clause allows you to conduction selection i.e. rows in a table.
- SELECT * FROM tablename means that you want to see all columns from a table

Arithmetic in SELECT clause

- You can construct a SELECT clause that contains arithmetic
- You may want to modify the way data is displayed, perform calculations etc
- We are not creating new columns for these calculations or changing the data in the database.
- The results appear only in the output

```
SELECT last_name, salary, salary + 300
FROM employee;
```

Arithmetic in the SELECT clause

- Precedence is the order in which the database management system evaluates the operators in the same expression.
- Oracle evaluates operators with higher precedence first * / + -
- Oracle evaluates operators with equal precedence from left to right within an expression.
- You can use parentheses to force the expression within the parentheses to be evaluated first.

```
SELECT last_name, salary, 12*salary + 100 FROM employees; SELECT last name, salary, 12*(salary +100) FROM employees;
```

NULL values in arithmetic

- In SQL, NULL is not zero or space, In SQL, zero is a number and space is a character.
- If any column value in an arithmetic expression is null, the result is null.
- If you try to divide by a null value, the result is null.
- If you try to divide by zero you get an error.

Where there was a null value in commission_pct would result in a null value in the last column

Column Aliases

- An Alias is a way of renaming a column heading in the output.
- Without aliases, when the result of a SQL statement is displayed, the name of the columns displayed will be the same as the column names in the table or a name showing an arithmetic operation such as 12*(salary +100)
- You will want your output to display in a more user friendly way

Column Aliases

A column alias:

- Renames a column heading
- Is useful with calculations
- Immediately follows the column name in the SELECT clause
- May have the optional AS keyword between the column name and alias
- Requires double quotation marks if the alias contains spaces or special characters, or is case-sensitive

Column Aliases

```
SELECT * | column | expr [AS alias], ...
FROM tablename;
SELECT last name AS name,
      commission pct AS commission
FROM employees;
SELECT last name "Name",
      commission pct "Commission Percentage"
FROM employees;
```

Concatenation

- Concatenation means to connect or link together in a series.
- The symbol is 2 vertical bars sometimes known as pipes
- Values on either side of the pipes are combined to make a single output column
- Syntax:

```
String1 || string2 || stringn
```

■ Concatenation is used to produce readable data output

```
SELECT department_id || ' ' || department_name
FROM departments;
```

Concatenation and Aliases

 Column aliases are useful when using the concatenation operator to ensure the heading is readable

```
SELECT department_id || ' ' || department_name AS "Department
Info"
FROM departments;
```

Concatenation and Literal Values

- A literal value is a fixed data value such as a character, number or date.
- 'dollars' 1000 'January 1, 2009' (number do not need quotes)
- You can create output that looks like a sentence or statement.

```
SELECT last_name || ' has a monthly salary of ' || salary ||'
dollars.' AS Pay
FROM employees;
```

DISTINCT

- You will want to eliminate duplicate rows
- For example if you select all the department id's from the employees table it will output many rows that are the same department id
- If you want to just see one row for each unique department id then you use DISTINCT

```
SELECT DISTINCT department_id
FROM employees;
```

■ DISTINCT affects all listed columns, returning rows that a unique across all columns. The keyword must appear first in SELECT clause

- Information sorted ascending order is familiar to us.
- It's what makes looking up a number in a phone book, finding a word in a dictionary, or locating a house by its street address relatively easy.
- SQL uses the ORDER BY clause to order data.
- The ORDER BY clause can specify several ways in which to order rows returned in a query.

- The default sort order is ascending.
- Numeric values are displayed lowest to highest.
- Date values are displayed with the earliest value first
- Character values are displayed in alphabetical order
- Null values are displayed last in ascending order and first in descending order
- NULLS FIRST specifies that NULL values should be returned before non-NULL values.
- NULLS LAST specifies that NULL values should be returned after non-NULL values.
- You can sort by more than one column (separate with commas).

 The following employees example uses the ORDER BY clause to order hire_date in ascending (default) order.

Note: The ORDER BY clause must be the last clause of the SQL

statement.

SELECT last_name, hire_date FROM employees ORDER BY hire date;

LAST_NAME	HIRE_DATE
King	17/Jun/1987
Whalen	17/Sep/1987
Kochhar	21/Sep/1989
Hunold	03/Jan/1990
Ernst	21/May/1991
De Haan	13/Jan/1993
Gietz	07/Jun/1994
Higgins	07/Jun/1994
Rajs	17/Oct/1995
Hartstein	17/Feb/1996

 You can reverse the default order in the ORDER BY clause to descending order by specifying the DESC keyword after the column name in the ORDER BY clause.

SELECT last_name, hire_date FROM employees ORDER BY hire_date DESC;

LAST_NAME	HIRE_DATE
Zlotkey	29/Jan/2000
Mourgos	16/Nov/1999
Grant	24/May/1999
Lorentz	07/Feb/1999
Vargas	09/Jul/1998
Taylor	24/Mar/1998
Matos	15/Mar/1998
Fay	17/Aug/1997
Davies	29/Jan/1997
Abel	11/May/1996

- You can order data by using a column alias.
- The alias used in the SELECT statement is referenced in the ORDER BY clause.

```
SELECT last_name, hire_date AS "Date
Started"
FROM employees
ORDER BY "Date Started";
```

LAST_NAME	Date Started	
King	17/Jun/1987	
Whalen	17/Sep/1987	
Kochhar	21/Sep/1989	
Hunold	03/Jan/1990	
Ernst	21/May/1991	
De Haan	13/Jan/1993	
Gietz	07/Jun/1994	
Higgins	07/Jun/1994	
Rajs	17/Oct/1995	
Hartstein	17/Feb/1996	

- It is also possible to use the ORDER BY clause to order output by a column that is not listed in the SELECT clause.
- In the following example, the data is sorted by the last_name column even though this column is not listed in the SELECT statement.

```
SELECT employee_id, first_name
FROM employees
WHERE employee_id < 105
ORDER BY last_name;
```

EMPLOYEE_ID	FIRST_NAME	
102	Lex	
104	Bruce	
103	Alexander	
100	Steven	
101	Neena	

Order of Execution

- The order of execution of a SELECT statement is as follows:
 - FROM clause: locates the table that contains the data
 - WHERE clause: restricts the rows to be returned
 - SELECT clause: selects from the reduced data set the columns requested
 - ORDER BY clause: orders the result set

Practice

Write a SELECT statement that outputs the following:

Partner Name	Area of Expertise	Expense Amount
Jennifer cho	Weddings	
Jason Tsang		
Allison Plumb	Event Planning	30000

■ The table is D_Partners with columns: first_name, last_name, expertise, and auth_expense_amt, order the output starting with the largest expense amount.
